Course Foundry

An AI system that creates and operates a course

Give the system an audience and a topic. It builds the course, prepares its launch, and supports the learner.

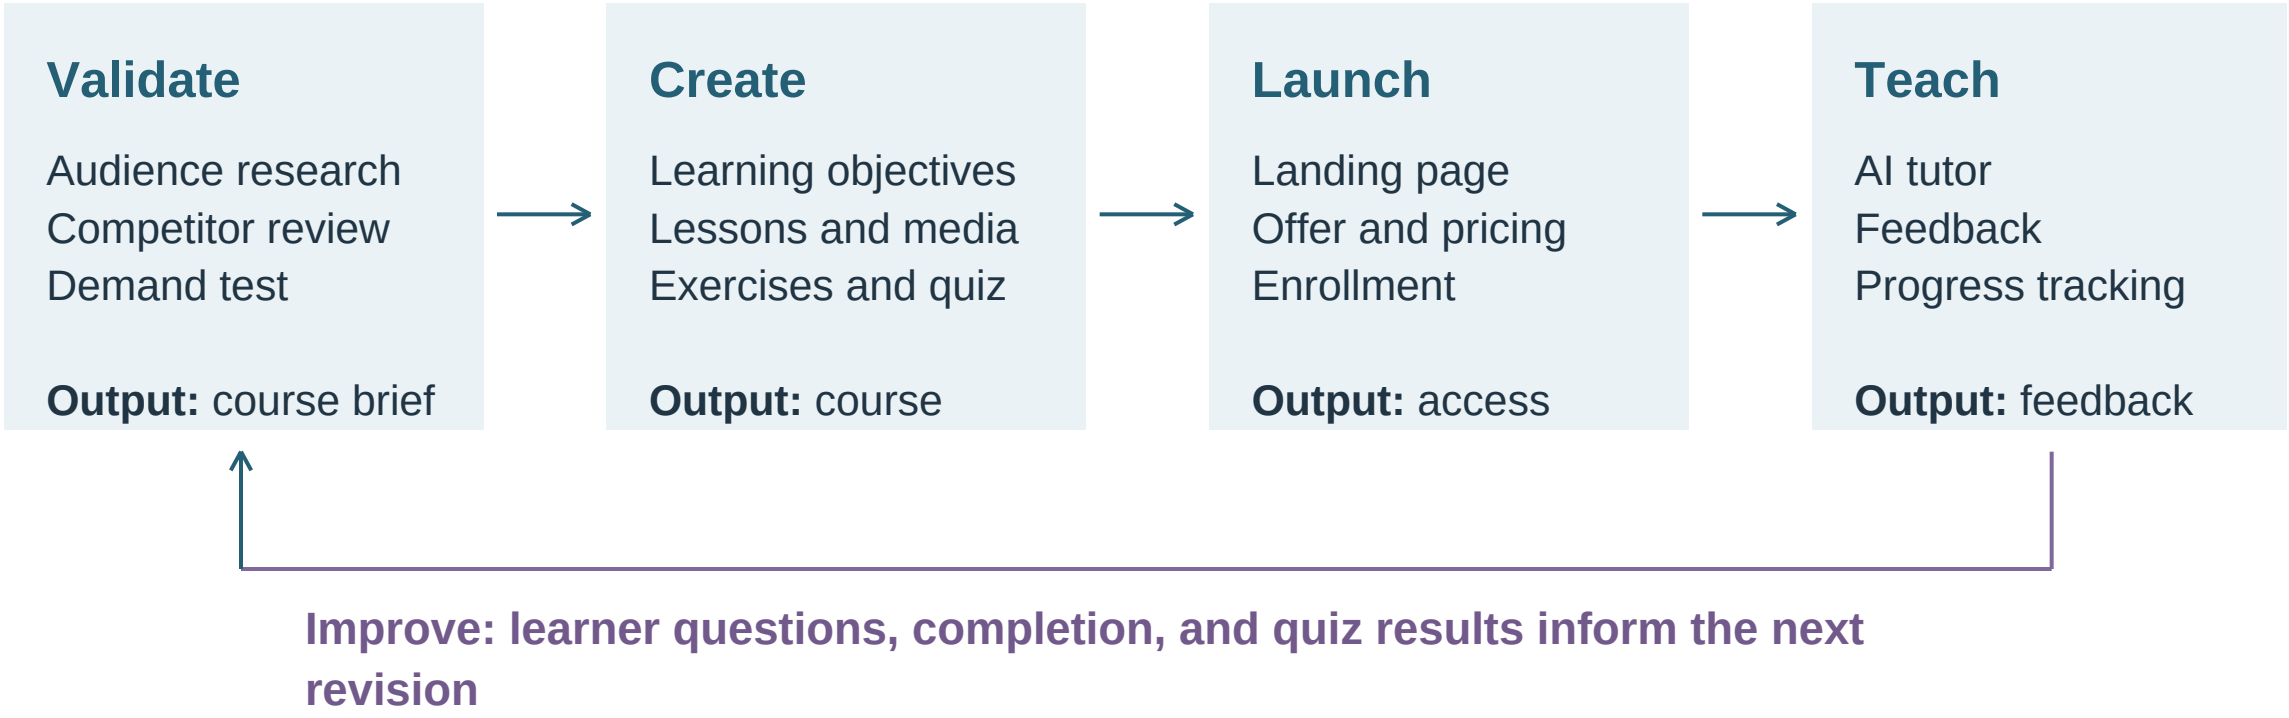

For independent educators with an audience, but limited time to build and run a new course.

AI-generated illustration: smartphone food photography

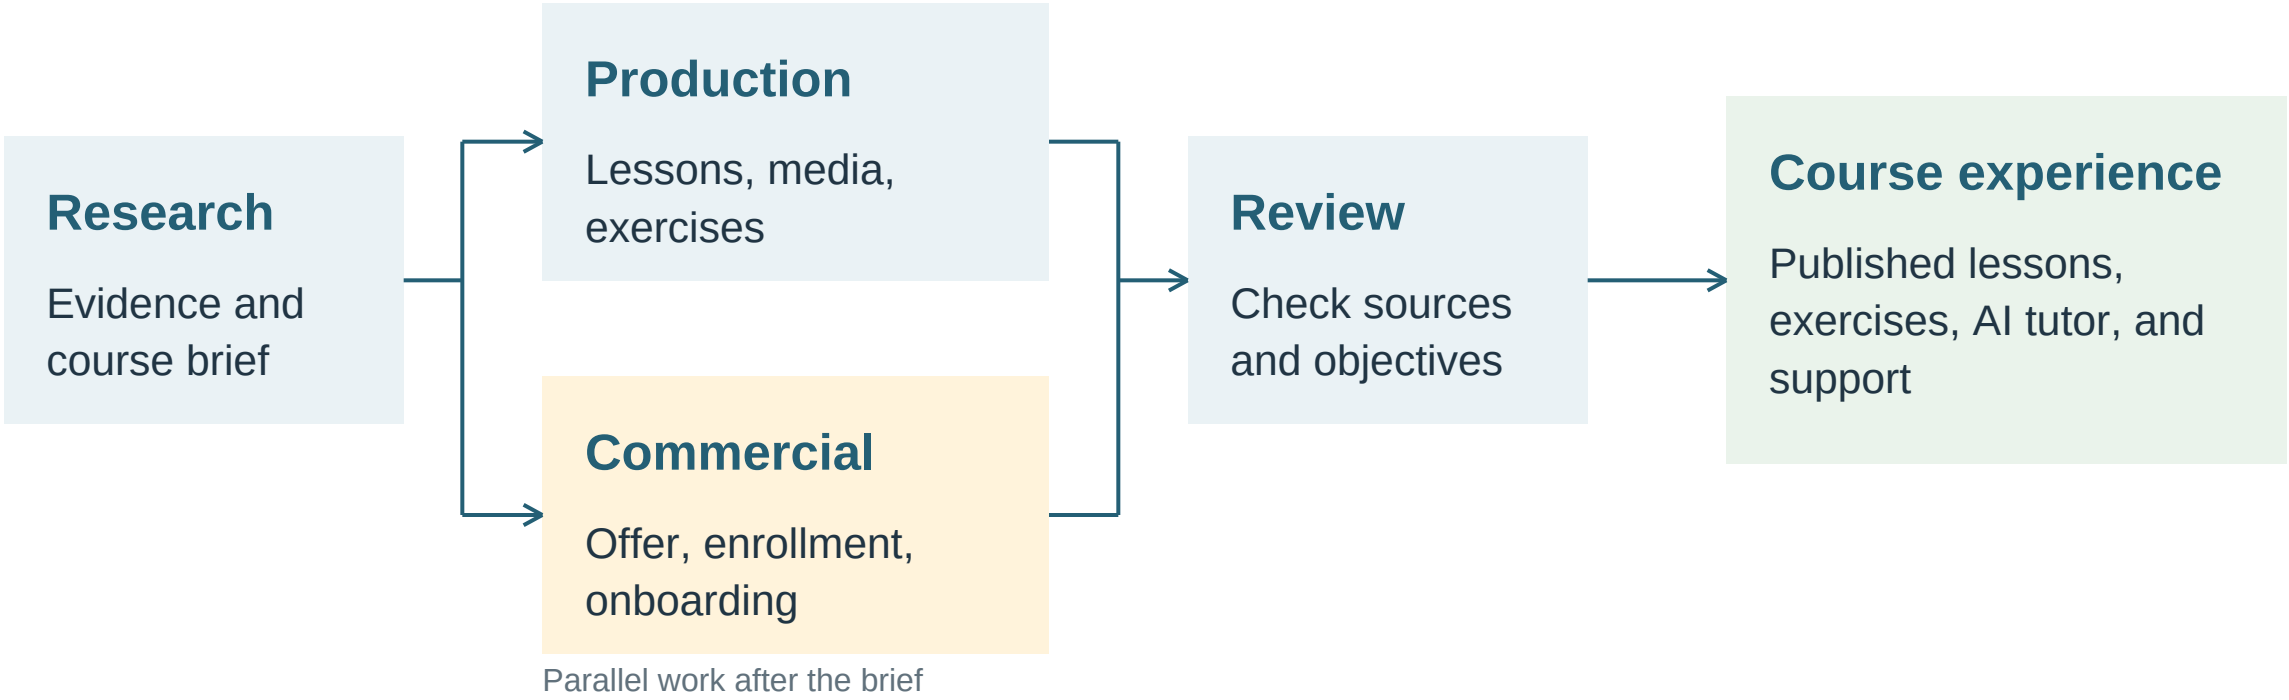

Hypothesis: a shared workflow can reduce handoff effort while preserving course quality.

One course, across its entire lifecycle

Pilot: one three-lesson course on smartphone food photography, generated from a topic brief.

Agents coordinate through shared state

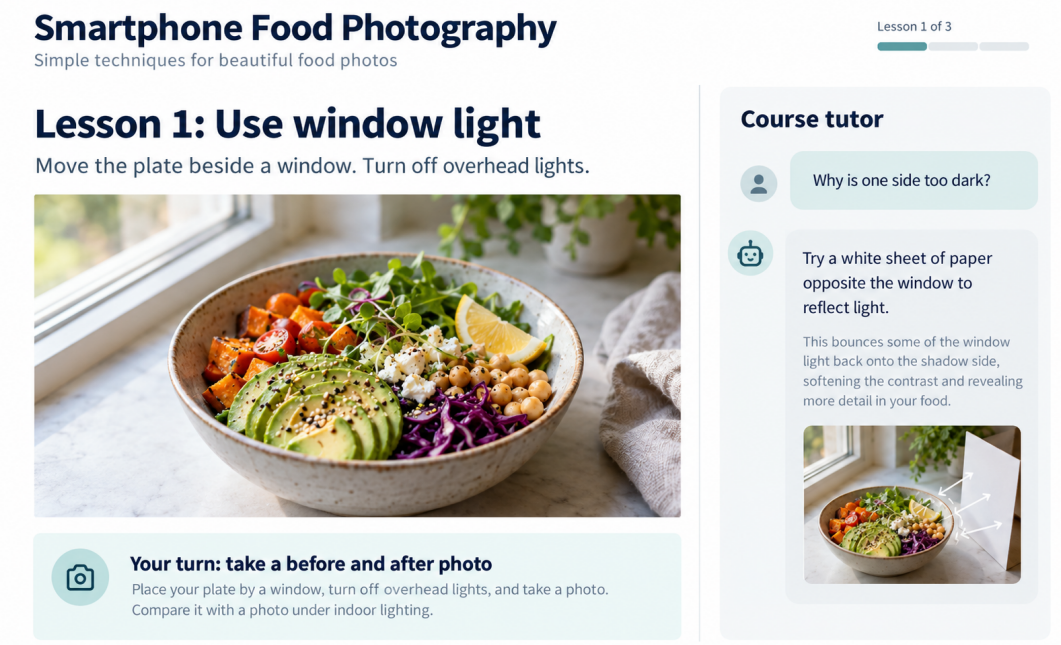

Parallel work after the brief

Shared state + orchestration

Python + SQLite coordinate tasks and state. Model, search, and speech APIs supply tools.

A small pilot tests the whole system

One topic. Three lessons. A complete learner experience.

AI-generated concept mockup, not a working product

Demand

Use real signup behavior. A small recruited pilot cannot establish market demand.

Quality

Review sources and lessons. Compare learner work before and after the course.

Reliability

Save progress and limit retries. Simulate purchases and emails.

Validation: demand, learning, and autonomy

Plan: sourced brief first, working course at midpoint, 5-10 learner pilot at final.

Learner evidence

INTEREST

Track unique visitors and signups, with counts and conversion rate. Keep recruited testers separate.

ENGAGEMENT

Track exercise starts, submissions, and returns. Diagnose friction with active time, retries, and help requests.

LEARNING

Score before/after photos on lighting, framing, and focus using one rubric and shuffled review order.

System tests

TUTOR ACCURACY

Check 15 course answers against a key. Test whether the tutor flags 5 outside-scope questions.

FAILURE RECOVERY

Inject an API failure and malformed output. Target: resume safely without duplicate lessons or lost progress.

HUMAN INTERVENTION

Log manual corrections and assistance per run. Report where the system still needs its creator.
